

TEAM CATALYST ALLIANCE – Final Review Meeting

UN SDG Goal 2: Zero Hunger – Surplus Food Redistribution Network

Date: Sunday, 09 Aug 2026

Time: 7:00 PM WAT | 8:00 PM SAST | 9:00 PM EAT

Platform: meet.google.com/iwn-zdrd-uwu

Duration: 45–60 minutes

Attendees

- Oke Oluwatoyin – Project Management
- Zoliswa Mokopu – Cybersecurity
- Omoruyi Igbinovia – Data Analytics
- Lydia Nganga – IT Automation with Python
- Esther Vincent – Digital Marketing

Meeting Notes

Discussion Summary

1. Data Integration and Validation

The team reviewed the available datasets and agreed that the MVP should prioritize reliable African data and reports to remain aligned with the project's problem statement and regional focus.

- The team reaffirmed that the project is being developed within the African context, with Nigeria, Kenya, and South Africa representing the primary country contexts reflected in the team's research and prototype.
- It was noted that publicly accessible operational retail food waste datasets for African countries are limited.
- The team agreed to prioritize African reports, statistics, and data sources over US-based operational datasets.
- Omoruyi's analysed dataset was identified as US-based and therefore unsuitable as the primary dataset for demonstrating the African-focused problem.
- The team agreed not to discard the analytical insights entirely, but to treat them as supporting evidence of how inventory analytics can identify surplus and prioritise redistribution opportunities, rather than as evidence of African retail food waste.
- Lydia's UNEP-based data for Kenya will remain part of the prototype, while Nigeria and South Africa data will be extracted from the UNEP Food Waste Index Report where possible.

- The team agreed that the origins and limitations of all datasets should be clearly documented to avoid misleading claims.

2. African Data Extraction and Prototype Updates

The team discussed the remaining data requirements for the website prototype.

- Lydiah will retain the existing prototype structure and incorporate additional African data where available.
- The team agreed to use the UNEP Food Waste Index Report as a key source for extracting relevant information for Nigeria and South Africa.
- AI tools may be used to assist with locating and extracting relevant information from the lengthy report, with the extracted information reviewed before being incorporated into the prototype.
- The prototype will therefore remain focused on demonstrating the proposed redistribution solution using relevant African evidence rather than forcing an unrelated US dataset into the MVP.
- The final data sources and limitations will be reflected in the project documentation and README.

3. Prototype and Presentation Alignment

The team agreed that the prototype and presentation should tell a consistent story.

- Lydiah's existing prototype will remain the basis of the MVP.
- Additional African data will be incorporated into the prototype before the presentation is finalized.
- Esther will develop the presentation slides and walkthrough video around the finalized prototype.
- The presentation will use the African research and prototype as its primary evidence base.
- Omoruyi's analytical findings may be used selectively as supporting evidence where they add value, provided they are clearly identified as being based on a non-African operational dataset.
- The team agreed that the presentation should not imply that the US dataset represents Nigerian, Kenyan, or South African retail conditions.

4. Presentation and Walkthrough Video

The team discussed the preparation of the final presentation and recorded walkthrough.

- Esther will work with Lydiah's prototype when developing the presentation.
- The presentation will explain the problem, African context, proposed solution, prototype functionality, and expected impact.
- The walkthrough video will demonstrate the website prototype and explain how the proposed platform would help connect food donors with organizations able to redistribute surplus food.
- Presentation content will be aligned with the final prototype data and supporting research.

- Charts and analytical findings may be incorporated selectively where they strengthen the explanation without creating confusion about the dataset's geographical origin.

5. Project Documentation and Final Deliverables

The team reviewed the remaining project documentation and agreed that final edits should be completed in line with the updated project direction.

- Oluwatoyin will complete the remaining edits to the project management documents.
- The Project Management Plan, Risk Register, Communication Plan, Research Report, Data Analysis Summary, and meeting records will be updated to reflect the final data approach.
- The Research Report will continue to emphasize African research and evidence.
- The Data Analysis Summary will retain the relevant analytical findings and charts, while clearly identifying the operational dataset as non-African.
- The README will be finalized after the prototype and supporting documents are sufficiently settled.
- The project timeline will be updated to reflect actual progress and remaining activities.

6. Project Coordination and Timeline

The team discussed the limited time remaining before submission and the need to complete dependent tasks quickly.

- Lydiah's prototype data updates need to be completed before Esther can fully finalize the presentation.
- Esther will continue preparing the presentation and walkthrough while the prototype is being finalized.
- Oluwatoyin will continue coordinating outstanding documentation and follow-ups.
- Zoliswa will conduct the security review once the prototype reaches its final/stable stage.
- Team members were encouraged to communicate outstanding issues and blockers promptly through WhatsApp.

Key Decisions

Decision	Reason
Prioritize African data and reports for the MVP.	Keeps the project aligned with its Sub-Saharan African problem statement and local grocery vendor focus.
Use the UNEP Food Waste Index Report	Provides a relevant African source and

to support Nigeria, Kenya, and South Africa data where available.	strengthens the project's evidence base.
Retain Lydia's existing prototype structure.	The prototype already demonstrates the proposed redistribution solution and can be refined rather than rebuilt.
Retain relevant analytical insights from Omoruyi's work as supporting evidence where appropriate.	The analysis demonstrates how inventory data can identify surplus and prioritise opportunities for redistribution.
Clearly identify the origin and limitations of all datasets.	Prevents misleading claims and ensures transparency with reviewers.
Align the presentation and walkthrough with the finalized prototype.	Ensures consistency across the project's final deliverables.
Complete documentation and README after the main prototype/data direction is finalized.	Prevents repeated edits and ensures the final documentation accurately reflects the finished MVP.

Action Items

Task	Owner	Due date	Status
Extract relevant Nigeria and South Africa information from the UNEP report	Lydia	As soon as possible	In Progress
Update prototype with relevant African data	Lydia	Before presentation finalization	In Progress
Review Omoruyi's analytical findings and identify any charts/insights suitable for supporting the final presentation and documentation.	Oluwatoyin / Team	09 - 10 Aug	In Progress
Conduct security review of the finalized prototype	Zoliswa	After prototype data update	Pending

Develop presentation slides using the finalized prototype	Esther	Before final submission	In Progress
Develop recorded walkthrough video	Esther	Before final submission	Pending
Finalize Project Management Plan	Oluwatoyin	10–11 Aug	In Progress
Update project timeline based on actual progress	Oluwatoyin	10–11 Aug	Pending
Finalize README	Oluwatoyin & Lydia	11–12 Aug	Pending
Complete final review of all project deliverables	Entire Team	12 Aug	Pending

Final Review Checklist

- Final prototype data validation.
- Security recommendations following prototype review.
- Whether selected analytical charts should be included in the final presentation.
- Final README review.
- Presentation rehearsal.
- Walkthrough video review.
- Final GitHub repository review.
- Final submission checklist.
